The term is considered to be American English slang and is commonly used by programmers. We'll go over some of the more common errors AutoCAD Serial Key users make when typing. We'll also discuss some basic keyboard shortcuts to help you become more efficient in your work. Accents AutoCAD allows you to place accents on certain letters in your input. AutoCAD treats the letter only as one symbol and uses the same settings for all variants. To see what kind of symbols AutoCAD recognizes, look in the [Options] dialog box. In the document preferences, choose [Character Symbols] and click on the panel with the contents as shown below. You will see the [Show] button on the left hand side of the panel. You can use this button to view the icons for each of the character symbols. You can click on a symbol to view the character for that symbol in the [Character List]. To add accents to your input, you can click on the plus sign or the minus sign, depending on whether the letter needs an accent. When you add an accent, AutoCAD will ask whether you want to use the character for that accent or for the letter that is being accentuated. If you don't want to change the accent or change the letter, simply click the no symbol button. Cut, Copy, and Paste AutoCAD supports three different types of selections. You can make a selection by choosing any one of these selection methods, or you can combine selection methods to make a particular type of selection. Lines To draw lines, you can select any single point or object, then press the spacebar. This will select all the points, lines, and arcs between the selected point and the next or previous point. If you hold the Shift key down, AutoCAD will select objects only from the cursor position. To select the next object, press the Tab key. To select the previous object, press the Shift-Tab key. To draw a line from the current cursor position to the previously selected object, hold the Ctrl key down and select the object. To draw a line from the current cursor position to the previously selected point, hold the Shift key down and select the point. Lines can be straight or curved. The path used to draw a curved line is automatically stored in the database for you. To
