KEYMACRO is an open-source application that emulates the MAC addresses of certain devices and rewrites them automatically using a user-defined format. It is designed to be used during system updates, as it allows you to change a device's MAC address even if it is in use. This can be useful if you wish to change the MAC address of a device such as a router or a PC, or if you want to swap two devices' MAC addresses, such as a wireless device and a wired one. KEYMACRO offers you a wide variety of options that you can use to control the entire process. It allows you to specify a device's MAC address, the location of the new MAC address, the name of the device and the name of the profile that the MAC address should be mapped to. You can then modify and save all these settings. Features of KEYMACRO: 1. Change the MAC address of a device and specify its name and location 2. Specify the new MAC address 3. Specify the MAC address range for which the MAC address should be automatically rewritten 4. Specify whether you want the device's current MAC address to be re-written 5. Specify whether the device should be rebooted 6. Specify whether you want the new MAC address to be automatically active after a reboot 7. Specify the profile to which the MAC address will be mapped 8. Select the new MAC address 9. Save the settings 10. Apply the settings 11. Reboot the device 12. Edit the settings 13. Apply the settings 14. Reboot the device 15. Log out 16. Click the "Update all settings" button 17. Click the "Delete all settings" button 18. Click the "Create the profile and apply settings" button 19. Click the "Apply settings" button Spectacle is a free image viewer for Linux that comes with a ton of features.
